

# Oxybutynin medication

Oxybutynin is a genitourinary antispasmodic medication, a

synthetically made tertiary amine antimuscarinic agent. It is produced under the brand names Ditropan, Ditropan XL, Oxytrol, Gelnique, Urotrol, Anturol and others. All these medicines contain Oxybutynin as a main component, all of them belong to the drug class called genitourinary smooth muscle relaxants.

  
**Gelnique 3%**  
(oxybutynin) gel 3%

The medicine is available in the form of tablets, oral solution, extended

-release tablets and transdermal system. Oxybutynin is designed to treat patients with overactive bladder who experience unpleasant symptoms such as sudden need to urinate, incontinence and frequent nocturnal urination. Being a muscle relaxant, Oxybutynin mitigates the spasms of the urinary tract and the bladder. This helps to diminish the symptoms of overactive bladder. This medicine is available with a prescription of a doctor who can professionally adjust the proper dose and duration of the treatment.
